

# Continuing Education Questionnaire

**Write Your Name:**

**Once this form is completed, please submit to [institute@neurorestorative.com](mailto:institute@neurorestorative.com)**

## **“TBI As A Chronic Health Condition”**

1. The TBI Model Systems National Database is designed to collect cross-sectional data.

- True**
- False**

2. The TBI Model Systems National Database can be used to make estimates of the US population 16 years old and older who received inpatient rehabilitation for a primary diagnosis of TBI.

- True**
- False**

3. Though 2 in 5 adults who receive rehabilitation for TBI have died within 5 years of their injury, this is primarily due to normal aging.

- True**
- False**

4. Persons with TBI are 50 times more likely to die from seizures than their same aged, sex and race/ethnicity matched counterparts in the general population.

- True**
- False**

5. Five years after injury, depression is more common in older adults than all other age categories.

- True**
- False**

## Continuing Education Questionnaire

6. Five years after injury, moderate to severe disability is more common in older adults than all other age categories.

- True
- False

7. Five years after injury, almost 40% of people still alive have declined in function from the level they reached 1 or 2 years after their injury.

- True
- False

8. A disease management approach employs preventive strategies and early intervention to minimize the long-term effects of a medical condition that is otherwise expected to cause progressive deterioration.

- True
- False

9. A disease management approach would address co-morbidities that were present both before and after the TBI.

- True
- False

10. Self-management is not a component of a disease management approach.

- True
- False
